Business Case: Delhivery - Feature Engineering

Delhivery is the largest and fastest-growing fully integrated player in India by revenue in Fiscal 2021. They aim to build the operating system for commerce, through a combination of world-class infrastructure, logistics operations of the highest quality, and cutting-edge engineering and technology capabilities.

5 rows × 24 columns

Features of the dataset:

Field	Description
data	Indicates whether the data is testing or training data
trip_creation_time	Timestamp of trip creation
route_schedule_uuid	Unique ID for a particular route schedule
route_type	Transportation type
FTL	Full Truck Load: FTL shipments reach the destination sooner with no other pickups or drop-offs

Field	Description
Carting	Handling system consisting of small vehicles (carts)
trip_uuid	Unique ID for a particular trip (may include different source and destination centers)
source_center	Source ID of trip origin
source_name	Source Name of trip origin
destination_center	Destination ID
destination_name	Destination Name
od_start_time	Trip start time
od_end_time	Trip end time
start_scan_to_end_scan	Time taken to deliver from source to destination
is_cutoff	Unknown field
cutoff_factor	Unknown field
cutoff_timestamp	Unknown field
actual_distance_to_destination	Distance in Kms between source and destination warehouse
actual_time	Actual time taken to complete the delivery (Cumulative)
osrm_time	Open-source routing engine time calculator (Cumulative)
osrm_distance	Open-source routing engine computed distance (Cumulative)
factor	Unknown field
segment_actual_time	Segment time. Time taken by the subset of the package delivery
segment_osrm_time	OSRM segment time. Time taken by the subset of the package delivery
segment_osrm_distance	OSRM distance. Distance covered by the subset of the package delivery
segment_factor	Unknown field

Key Concepts

1. **Feature Creation**
   - Definition: The process of creating new features from existing data to improve model performance.
   - Importance: Helps in enhancing the predictive power of the model by providing more relevant information.
2. **Relationship between Features**
   - Definition: Understanding how features interact and influence each other.
   - Importance: Can help in feature selection and engineering to improve model accuracy.
3. **Column Normalization / Column Standardization**
   - Definition: Techniques used to scale features to a similar range.
   - Importance: Essential for algorithms that rely on the distance between data points, like KNN.
4. **Handling Categorical Values**
   - Definition: Methods to convert categorical data into a numerical format.
   - Importance: Necessary for machine learning algorithms that require numerical input.
5. **Missing Values and Outlier Treatment**
   - Definition: Strategies to handle missing data and identify outliers.
   - Types of Outliers:
     - **Univariate Outliers**: Extreme values in a single feature.
     - **Multivariate Outliers**: Unusual combinations of values across multiple features.
   - Importance: Ensures data quality and improves model robustness.

Exploratory Data Analysis

Merging of rows and aggregation of fields

How to begin"

Since delivery details of one package are divided into several rows (think of it as connecting flights to reach a particular destination). Now think about how we should treat their fields if we combine these rows? What aggregation would make sense if we merge. What would happen to the numeric fields if we merge the rows.

In [58]:
```
grouping_1 = ['trip_uuid', 'source_center', 'destination_center']
data_1 = data.groupby(by = grouping_1, as_index = False).agg({'data' : 'first',
                                                              'route_type' : 'first',
                                                             'trip_creation_time' : 'first',
                                                             'source_name' : 'first',
                                                             'destination_name' : 'last',
                                                             'od_start_time' : 'first',
                                                             'od_end_time' : 'first',

```

In-depth analysis and feature engineering:

Compare the difference between od_total_time and start_scan_to_end_scan. Do hypothesis testing/ Visual analysis to check

STEP-1 : Set up Null Hypothesis

> Null Hypothesis (H0) - od_total_time (Total Trip Time) and start_scan_to_end_scan (Expected total trip time) are same. Alternate Hypothesis (HA) - od_total_time (Total Trip Time) and start_scan_to_end_scan (Expected total trip time) are different.

STEP-2 : Checking for basic assumpitons for the hypothesis

> Distribution check using QQ Plot Homogeneity of Variances using Lavene's test

STEP-3: Define Test statistics; Distribution of T under H0.

> If the assumptions of T Test are met then we can proceed performing T Test for independent samples else we will perform the non parametric test equivalent to T Test for independent sample i.e., Mann-Whitney U rank test for two independent samples.

STEP-4: Compute the p-value and fix value of alpha.

> We set our alpha to be 0.05

STEP-5: Compare p-value and alpha.

Based on p-value, we will accept or reject H0.

p-val > alpha : Accept H0

p-val < alpha : Reject H0

Business Insights

The data is given from the period '2018-09-12 00:00:16' to '2018-10-08 03:00:24'.

There are about 14817 unique trip IDs, 1508 unique source centers, 1481 unique destination_centers, 690 unique source cities, 806 unique destination cities.

Most of the data is for testing than for training.

Most common route type is Carting.

The names of 14 unique location ids are missing in the data.

The number of trips start increasing after the noon, becomes maximum at 10 P.M and then start decreasing.

Maximum trips are created in the 38th week.

Most orders come mid-month. That means customers usually make more orders in the mid of the month.

Most orders are sourced from the states like Maharashtra, Karnataka, Haryana, Tamil Nadu, Telangana

Maximum number of trips originated from Mumbai city followed by Gurgaon Delhi, Bengaluru and Bhiwandi. That means that the seller base is strong in these cities.

Maximum number of trips ended in Maharashtra state followed by Karnataka, Haryana, Tamil Nadu and Uttar Pradesh. That means that the number of orders placed in these states is significantly high.

Maximum number of trips ended in Mumbai city followed by Bengaluru, Gurgaon, Delhi and Chennai. That means that the number of orders placed in these cities is significantly high.

Most orders in terms of destination are coming from cities like bengaluru, mumbai, gurgaon, bangalore, Delhi.

Features start_scan_to_end_scan and od_total_time(created feature) are statistically similar.

Features actual_time & osrm_time are statitically different.

Features start_scan_to_end_scan and segment_actual_time are statistically similar.

Features osrm_distance and segment_osrm_distance are statistically different from each other.

Both the osrm_time & segment_osrm_time are not statistically same.

Recommendations

The OSRM trip planning system needs to be improved. Discrepancies need to be catered to for transporters, if the routing engine is configured for optimum results.

osrm_time and actual_time are different. Team needs to make sure this difference is reduced, so that better delivery time prediction can be made and it becomes convenient for the customer to expect an accurate delivery time.

The osrm distance and actual distance covered are also not same i.e. maybe the delivery person is not following the predefined route which may lead to late deliveries or the osrm devices is not properly predicting the route based on distance, traffic and other factors. Team needs to look into it.

Most of the orders are coming from/reaching to states like Maharashtra, Karnataka, Haryana and Tamil Nadu. The existing corridors can be further enhanced to improve the penetration in these areas.

Customer profiling of the customers belonging to the states Maharashtra, Karnataka, Haryana, Tamil Nadu and Uttar Pradesh has to be done to get to know why major orders are coming from these atates and to improve customers' buying and delivery experience.

From state point of view, we might have very heavy traffic in certain states and bad terrain conditions in certain states. This will be a good indicator to plan and cater to demand during peak festival seasons.
